

RemoveFontResource

The **RemoveFontResource** function removes the fonts in the specified file from the Windows font table.

```
BOOL RemoveFontResource(  
    LPCTSTR lpFileName    // address of font-resource filename  
);
```

Parameters

lpFileName

Points to a null-terminated string that names a font resource file.

Return Value

If the function succeeds, the return value is TRUE.

If the function fails, the return value is FALSE. To get extended error information, call [GetLastError](#).

Remarks

An application that adds or removes fonts from the Windows public font table should notify other windows of the change by sending a WM_FONTCHANGE message to all top-level windows in the system. The application sends this message by calling the [SendMessage](#) function with the *hwnd* parameter set to HWND_BROADCAST.

If there are outstanding references to a font, the associated resource remains loaded until no device context is using it.
